

X12 Co.,Ltd. retro-reflective sphere

The marker is constructed from two hemispheres and a central pin. The difference between hemispheres is that the right one is drilled. The two hemispheres are coated with 3M 8710 reflective foil. The two hemispheres are tightly glued to the central pin. The central pin can be with threads (p.e. M3 or M4) or with a snap hole. The 3 detail are extremely accurate. The 3M foil is glued in a special way (knowhow X12) so that the difference in the reflective ability from all viewing points is very little.

We can make spheres with a diameter from 9.0 mm up to 32.0 mm
